

Scannograms

This is an 8th grade art project that was assigned. It's a digital still life portrait. It's not a traditional portrait because it doesn't include a photo of the student. They were asked to bring in 8-10 three dimensional objects that represented their interests. (For example: sports equipment, collections, items representing games and hobbies that they enjoy.) Once they brought in all the items they needed for the digital still life they arranged them on the scanner in 3 different compositions. Then they study each of the three scans and chose the best composition to work with. They were given a checklist of the requirements for the final digital still life. I also gave a quick demonstration on the tools of Photoshop. They had to add their name, use a filter, alter the color and experiment with drawing/painting tools to enhance one part of their picture.

Examples of Scannograms:
